

Humes knows Irrigation

Humes provide a total irrigation design and advice package.

Utilising Watertrac software, Humes can demonstrate the economic payback of irrigation. By factoring in variables like farming practice, proposed irrigated area, water source, soil type/structure, drainage and local climate, Humes assess pasture growth (KgDm) and evaluate these against capital outlay, financing and running costs to produce a cost benefit report.

We know well-managed water is a farm's lifeblood...

We understand the vital importance of water management. Working in the stock water and pastoral irrigation markets our mission is to provide a total design, hardware and implementation package — customised to your needs.

Our rural territory manager will activate the process, starting with our on farm design and advice service which

enables us to tailor effective irrigation systems that fit your farm's requirements. This is backed up by a comprehensive range, including Irrigation Pods, PVC, PE pipes and fittings.

Develop your irrigation potential — call your Rural Territory Manager today.
